AI can draft your test cases. Can you prove they are right?

Engineers spend their days on requirements, test cases, logs, FMEAs and reports. This book shows you how to hand the routine parts to Claude without losing traceability, rigour or confidentiality.

You will build ten real tools for one fictional product, the WLC-200 window-lift controller: from a requirements reviewer to a nightly validation assistant. Every tool was run for real, and every result was checked by code against an engineer's answers.

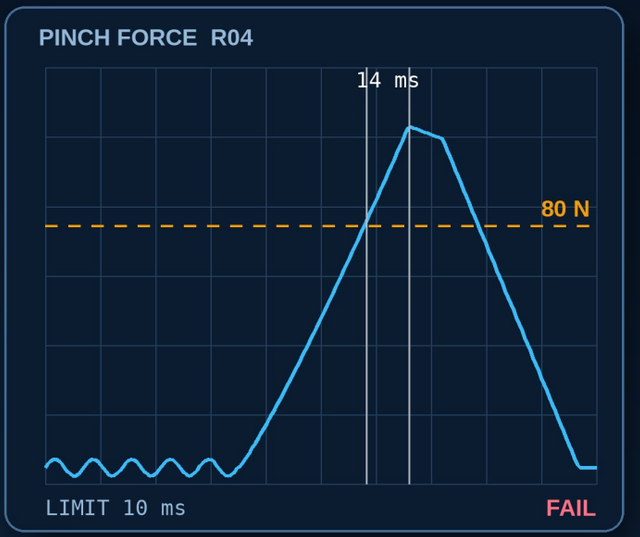

Inside you will learn:

- What you may and may not send to an AI
- Prompting for precise engineering work
- Requirements review and test case generation
- Spec change impact and traceability
- Test log analysis and Word reports
- Defect triage and FMEA drafting
- A knowledge assistant that quotes its sources
- Evaluation, rollout and governance

Aadhavan Muthurengan is an automation and AI professional with more than 15 years of experience in the automotive industry, where Aadhavan has built in-house tools that transformed product development and validation.
